vbOnline Pro Condition Monitoring System
Datasheet
Description

The vbOnline Pro Condition Monitoring System uses sophisticated signal processing algorithms together with machinery operating states to monitor assets continuously. This system is part of a condition based maintenance program that identifies problems before assets begin to fail.

Benefits of the vbOnline Pro Condition Monitoring System are:

- Cost savings from reduced machinery down time
- Early detection of bearing defects
- Reduction of damage to assets

The monitoring system's key features are:

- Signal conditioning
- Alarming
- Speed inputs
- Control system communication

The vbOnline Pro Condition Monitoring System communicates with System 1, machine control systems and imports data from external Modbus sensor systems via dual Ethernet connections. The analog input channels support standard industrial accelerometers using 24 bit analog-to-digital conversion over a 40 kHz bandwidth to monitor rolling element bearing machinery and all gearbox configurations.

The vbOnline Pro Condition Monitoring System supports monitoring machinery that works through numerous operating states, power levels, speeds, loads or modes. Data collection can be controlled, compartmentalized and alarmed by any combination of measured parameters, including speed, vibration amplitude, individual measurement alarm status and any parameter from external sources via Modbus.

Sophisticated signal processing algorithms extract measurement and health indices from each accelerometer point. The algorithms can be custom tuned to specific bearing and gear box characteristics.

The vbOnline Pro Condition Monitoring System exports trended measurements like direct, bias, speed, gap as well as channel NOT OK status to third party systems such as DCS via Modbus over ethernet.

The vbOnline Pro Condition Monitoring System components are the vbOnline Pro monitor, System 1, Bently Nevada Monitor Configuration software, transducers, and cables.
